Unable to backup restored VM

Hello everyone,

I restored a VM from a backup on a newly installed system. After a more experienced friend helped reconfigure the VM to do its job on its new metal home I wanted to back it up. Here I ran into some trouble because Proxmox says the VM's system disk does not exist (see code 1 below). The hardware configuration shows the disk as being in the storage location from the Proxmox instance it was backed up on (see screenshot 1 below). The hardware configuration shows it as being on storage location "local-zfs". "local-zfs" does not exist on this system (see screenshot 2 below). I found the current location of the system disk by using the "find /dev | grep 104" command (see code 2 below).

I cannot move the storage to another disk (screenshot 3).

Can anyone please tell me the commands I need to run to get my VM system disk into a .raw file and defined in the configuration of my VM so I can back it up?

Many thanks for your help in advance.

```

Can you move the VM storage to Local as outlined in this photo?

https://ostechnix.com/wp-content/uploads/2022/08/Move-Proxmox-VM-To-Different-Disk.png

No because Proxmox says it does not exist.

I did try an experiment with a sacrificial VM.

```
zfs send rpool/data/vm-105-disk-0 | zfs receive /NASZ001/subvol-105-disk-0
```

This moved the storage but then I could not find it through the GUI and did not know what to do next. The solution to this conundrum lies on the CLI and not the GUI, I suspect.

Hi,

This is solved. The solution was to go to Datacenter->Storage->Add->ZFS.

I pointed local-zfs to rpool/data.

After that I was able to backup my VM.

Many thanks to Fiona over at the Proxmox Forum.

I tried that with a sacrificial VM. It did not work. Then when I changed it back to the original value that did not work either.

How did you get the storage location when creating the VM?

Did you pass through the drive for the VM OS?

When you created the VM you should have had the choices of the storage pools you have showed us.

I'm looking at this using GUI to create a VM for reference

Try adding back the storage in the datacenter->storage tab where you specify the path of the zfs dataset where the VM's disk are located (look like it's rpool/data) and name it "local-zfs"

post the contents of your

```
/etc/pve/storage.cfg
/etc/pve/qemu-server/104.conf
```
